RE: [REDACTED] AA-9737

This 34-year-old employee was identified in May, 1990, as having urinary bladder changes consisting in a bladder tumor.

These changes were determined by urologic specialist examination and by pathologic tissue review. The confirmed diagnosis is papillary transitional cell carcinoma of the urinary bladder, Grade II, without invasion of the bladder wall and without metastasis.

During his predominant work career as a chemical operator, he had the exposure to the suspect carcinogens, alpha-Naphthylamine and ortho-Toluidine in the Hydrogen Reduction and Oxyamine Buildings. His exposure is stated to be only Du Pont. The potential exposure period began in August, 1982. He was not on the CW Urinary Pap Program.

He never smoked.

Date of Discovery is 5/23/90.

Date of Administration Diagnosis is

Impairment for Worker's Compensation is 0% based upon no structural anatomic alteration present in the genitourinary tract.

This compilation is presented for Management decision as to whether Du Pont accepts responsibility under applicated principles of worker's compensation law for appropriate disability compensation and related medical expense reimbursement.
